

Practical-3

Problem-1

1. I used the wrong loop condition, so the program was checking unnecessary elements.

Ans I corrected the loop to:

```
for (int j = 0; j < n - i - 1; j++)
```

This helps the program avoid checking the elements that are already sorted.

Problem-2

1. I incorrectly incremented the mid pointer after swapping a 2 with the element at high

Ans After swapping 2 with arr[high] , I only decrease high and do not increase mid, because the new element at mid still needs to be checked.
